

Crypto Pulse

Strategy & Backtest Report

Date: May 23, 2026 | Timeframe: 4H | Capital: \$10,000 USDT | Period: 1 year

1. Strategy Overview

Crypto Pulse is a hybrid trend + bounce strategy designed for cryptocurrency USDT pairs with daily volume above 50M. It adapts its behavior based on whether the market is trending or ranging.

Key Features:

- Dual regime detection: TREND mode (EMA separation > 0.3%) vs RANGE mode
- ATR-based Stop Loss (1.5x ATR) and Take Profit (3.0x ATR) — adapts to each pair
- Trailing stop to breakeven when price moves 1x ATR in favor
- Volume confirmation filter (1.5x avg in trend, 1.2x in range)
- RSI cross + engulfing pattern detection for entries

Default Parameters:

EMA Fast / Slow	21 / 55	RSI Period	14
ATR Period	14	ATR SL Mult	1.5x
ATR TP Mult	3.0x	RSI OB / OS	78 / 22
Risk per Trade	1.5%	Trend Sep %	0.3%

Entry Rules — TREND mode:

- LONG: EMA21 > EMA55 + RSI crosses above 50 + price closes above EMA21 + volume confirmed
- SHORT: EMA21 < EMA55 + RSI crosses below 50 + price closes below EMA21 + volume confirmed

Entry Rules — RANGE mode:

- LONG: RSI bounces from <=35 + price touches/above EMA55 + bullish engulfing or volume
- SHORT: RSI drops from >=65 + price touches/below EMA55 + bearish engulfing or volume

Exit Rules:

- Stop Loss hit (ATR-based)
- Take Profit hit (ATR-based)
- RSI extreme (>78 long, <22 short)
- EMA cross against position direction
- Trailing: SL moves to breakeven after 1x ATR move in favor

2. Backtest Results

Par	Trades	Win Rate	Profit Factor	Retorno	Max DD	Equity Final
BTCUSDT	6	33.3%	0.82	-1.38%	7.65%	\$9,861
ETHUSDT	9	22.2%	1.01	+0.15%	6.25%	\$10,015
SOLUSDT	5	60.0%	5.18	+16.63%	3.70%	\$11,663
BNBUSDT	3	33.3%	0.56	-2.13%	4.68%	\$9,787

3. Analysis by Pair

BTCUSDT

- 6 trades in 1 year, only 2 winners
- Highest drawdown at 7.65%
- BTC's lower volatility relative to price means fewer signals pass volume filter
- Slight loss of -1.38%

ETHUSDT

- Most active pair with 9 trades
- Very low win rate (22.2%) but profit factor near 1.0
- 2 winning trades almost exactly offset 7 losing trades
- Practically breakeven at +0.15%

SOLUSDT

- Best performer: +16.63% return with only 3.70% max drawdown
- 60% win rate with outstanding profit factor of 5.18
- SOL's higher volatility creates better ATR-based risk/reward setups
- 3 wins out of 5 trades — winners significantly larger than losers

BNBUSDT

- Least active with only 3 trades in the period
- 1 winner vs 2 losers
- Worst return at -2.13%
- BNB's lower volatility generates few qualifying signals

4. Conclusions & Recommendations

1 SOL is the clear winner

The strategy works best on higher-volatility assets where ATR-based levels create meaningful risk/reward ratios. SOL's price action consistently generates quality setups.

2 Highly conservative approach

Only 3 to 9 trades per year due to strict multi-filter entry requirements (EMA alignment + RSI cross + volume confirmation). This is by design — quality over quantity.

3 Drawdowns are well-controlled

Maximum drawdown across all pairs was 7.65% (BTC). ATR-based stops adapt to volatility, and the trailing stop to breakeven mechanism protects open profits.

4 Volume filter is crucial

Prevents false entries during low-conviction moves. The different multipliers for trend (1.5x) vs range (1.2x) modes add adaptability.

5 Recommended improvements

Consider widening RSI thresholds (e.g., 45-55 instead of 48-52) for more trend signals. Testing on 1H timeframe could increase trade frequency while maintaining the same logic. Adding ADX as a trend strength filter could improve TREND mode entries.
